**"We Preserve Wood"**

## Log Homes

Log homes are a big investment. Protect your home from mold, decay and insects.

Genics' Cobra™ products (known as Postguard™ in Canada) are vastly different from the older, traditional wood pole treatment products. We have developed, tested and patented a new, more effective, easier to apply and environmentally friendly line of wood preservative products.

Wood rot and decay happen at the ground line. The Cobra™Rod targets this area and prevents fungal decay and insect infestation from taking up residence.

Genics' revolutionary combination of copper and boron has proven effective, safe and easy to use. North American utilities trust the Cobra™Rod to extend the life of their wooden poles. Now you can benefit from this simple solution!

Pressure treatment of lumber used for buildings and fences help protect the exterior, however, most pressure treated wood fails due to internal rot. Aging & drying creates checks, which allows moisture and fungal spores to penetrate and attack unprotected wood.

Cobra™Rods, inserted at the groundline, will use the moisture in the post to dissolve the rod and set up an effective internal defence. Cobra™Plugs will seal the penetration hole.

This photo illustrates the devastation caused by an ant infestation in a log.
